Batch 3 – DevOps

Lab Exercise 16– Terraform Variables with Command

Line Arguments Objective:

Learn how to pass values to Terraform variables using command line arguments.

Prerequisites:

- Terraform installed on your machine.
- Basic knowledge of Terraform variables.

Steps:

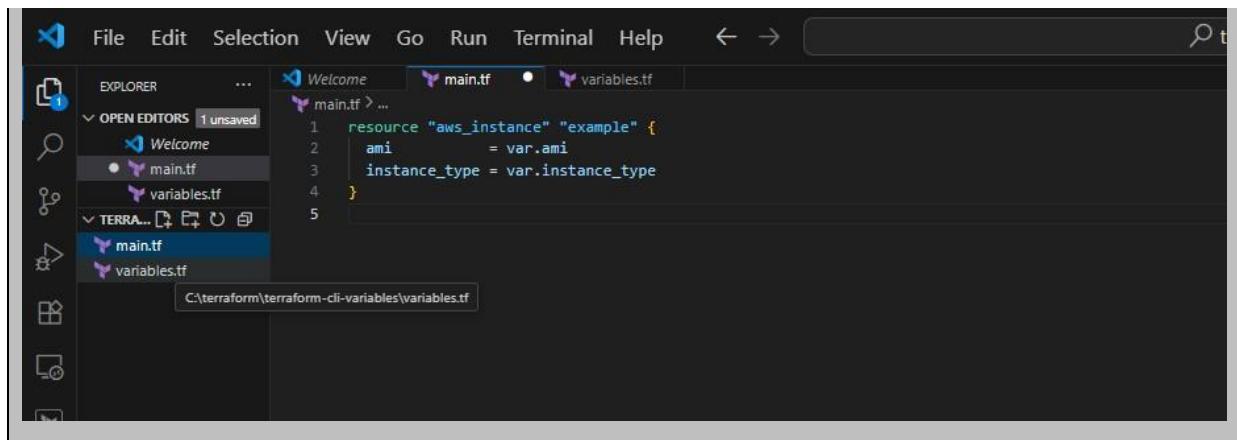

1. Create a Terraform Directory:

```
mkdir terraform-cli-variables cd  
terraform-cli-variables
```

2. Create Terraform Configuration Files:

- Create a file named main.tf: # instance.tf

```
resource "aws_instance" "example" {  
    ami      = var.ami  
    instance_type = var.instance_type  
}
```

The screenshot shows the Visual Studio Code interface. The Explorer sidebar on the left has a 'TERRAFORM-CLI-VARIABLES' section expanded, containing 'main.tf' and 'variables.tf'. The main editor area shows 'main.tf' with the following code:

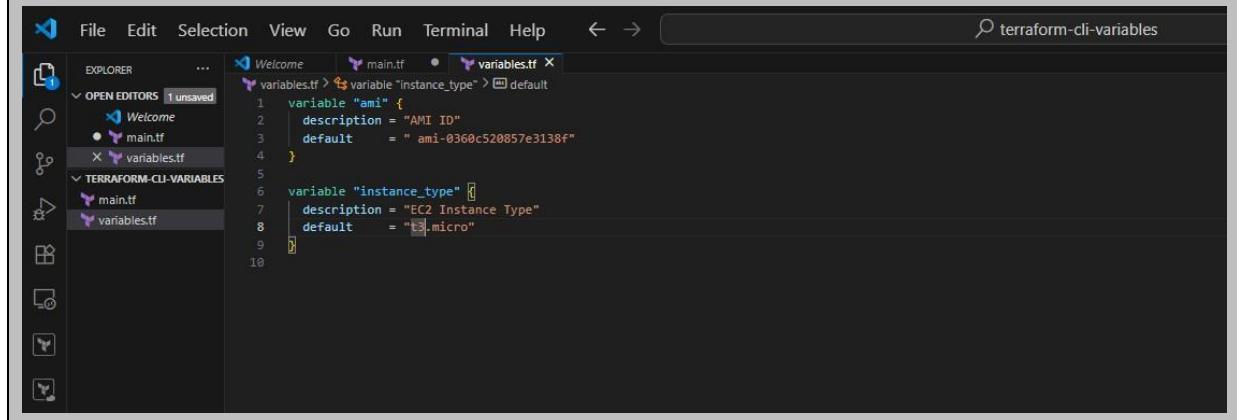

```
resource "aws_instance" "example" {
  ami           = var.ami
  instance_type = var.instance_type
}
```

- Create a file named variables.tf:

```
# variables.tf
```

```
variable "ami" {
  description = "AMI ID"
  default    = "ami-08718895af4dfa033"
}

variable "instance_type" {
  description = "EC2 Instance Type"
  default    = "t2.micro"
}
```

The screenshot shows the Visual Studio Code interface. The Explorer sidebar on the left has a 'TERRAFORM-CLI-VARIABLES' section expanded, containing 'main.tf' and 'variables.tf'. The main editor area shows 'variables.tf' with the following code, where the variable definitions are highlighted in blue:

```
variable "ami" {
  description = "AMI ID"
  default    = "ami-0360c520857e3138f"
}

variable "instance_type" {
  description = "EC2 Instance Type"
  default    = "t2.micro"
}
```

3. Use Command Line Arguments:

- Open a terminal and navigate to your Terraform project directory.
- Run the terraform init command:

terraform init

```
C:\terraform\terraform-cli-variables>terraform init
Initializing the backend...
Initializing provider plugins...
      |#
      + provider.aws: v3.32.0

Terraform has been successfully initialized!

You may now begin working with Terraform. Try running "terraform plan" to see
any changes that are required for your infrastructure. All Terraform commands
should now work.

If you ever set or change modules or backend configuration for Terraform,
rerun this command to reinitialize your working directory. If you forget, other
commands will detect it and remind you to do so if necessary.
```

- Run the terraform apply command with command line arguments to set variable values:

```
C:\terraform\terraform-cli-variables>terraform apply
No changes. Your infrastructure matches the configuration.

Terraform has compared your real infrastructure against your configuration and found no differences, so no changes are needed.

Apply complete! Resources: 0 added, 0 changed, 0 destroyed.

C:\terraform\terraform-cli-variables>
```

terraform plan -var="ami=ami-0522ab6e1ddcc7055" -var="instance_type=t3.micro"

```
C:\terraform\terraform-cli-variables>terraform apply -var="ami=ami-0360c520857e3138f" -var="instance_type=t3.micro"
No changes. Your infrastructure matches the configuration.

Terraform has compared your real infrastructure against your configuration and found no differences, so no changes are needed.

Apply complete! Resources: 0 added, 0 changed, 0 destroyed.
```

- Adjust the values based on your preferences.

4. Test and Verify:

- Observe how the command line arguments dynamically set the variable values during the apply process.

- Access the AWS Management Console or use the AWS CLI to verify the creation of resources in the specified region.

5. Clean Up:

After testing, you can clean up resources:

```
terraform destroy
```

Confirm the destruction by typing yes.

6. Conclusion:

This lab exercise demonstrates how to use command line arguments to set variable values dynamically during the terraform apply process. It allows you to customize your Terraform deployments without modifying the configuration files directly. Experiment with different variable values and observe how command line arguments impact the infrastructure provisioning process.
